Programming Languages

# Abstract Data Types and Modules

Chengkai Li  
Fall 2007

Lecture 12 – ADT and Modules, Fall 2007 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007 1

## Why ADT is important

- Bumper sticker for Computer Science

[http://www.geocities.com/krishna\\_kunchith/misc/bscs.html](http://www.geocities.com/krishna_kunchith/misc/bscs.html)

- “Get your data structures correct first, and the rest of the program will write itself.”  
David Jones

Lecture 12 – ADT and Modules, Fall 2007 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007 2

## Data Types

- Predefined
- Type constructors: build new data types
- How to provide “queue”?
  - What should be the data values?
  - What should be the operations?
  - How to implement (data representation, operations)?

Lecture 12 – ADT and Modules, Fall 2007 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007 3

## The “Queue”

Lecture 12 – ADT and Modules, Fall 2007 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007 4

## What are inadequate here?

- The operations are not associated with the data type
  - You can use the operation on an invalid value.
- Users see all the details:
  - direct access to data elements, implementations
  - Implementation dependant
  - Users can even mess up with things

Lecture 12 – ADT and Modules, Fall 2007 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007 5

## What do we want?

- For basic types:
  - 4 bytes or 2 bytes, users don’t need to know.
  - Can only use predefined operations.
- Similarly, for the “Queue” data type:
  - ?

Lecture 12 – ADT and Modules, Fall 2007 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007 6

## Abstract Data Type

- **Encapsulation:**  
all definitions of allowed operations for a data type in one place.
- **Information Hiding:**  
separation of implementation details from definitions. Hide the details .

Lecture 12 – ADT and Modules,  
Fall 2007

CSE3302 Programming Languages, UT-Arlington  
©Chengkai Li, 2007

7

## Algebraic Specification of ADT

- **Syntactic specification (signature, interface):**  
the name of the type, the prototype of the operations
- **Semantic specification (axioms, implementation):**  
guide for required properties in implementation  
mathematical properties of the operations

They don't specify:

- data representation
- implementation details

Lecture 12 – ADT and Modules,  
Fall 2007

CSE3302 Programming Languages, UT-Arlington  
©Chengkai Li, 2007

8

## Syntactic Specification

```
type queue(element) imports boolean
operations:
  createq: queue
  enqueue: queue × element → queue
  dequeue: queue → queue
  frontq: queue → element
  emptyq: queue → boolean
```

- **imports:** the definition queue needs boolean
- **Parameterized data type (element)**
- **createq:** not a function, or viewed as a function with no parameter

Lecture 12 – ADT and Modules,  
Fall 2007

CSE3302 Programming Languages, UT-Arlington  
©Chengkai Li, 2007

9

## Algebraic Specification

**variables:**  $q$ : queue;  $x$ : element

**axioms:**

```
emptyq(createq) = true
emptyq(enqueue(q,x)) = false
frontq(createq) = error
frontq(enqueue(q,x)) = if emptyq(q) then x
                        else frontq(q)
dequeue(createq) = error
dequeue(enqueue(q,x)) = if emptyq(q) then q
                        else enqueue(dequeue(q),x)
```

- **error axiom (exceptions)**

Lecture 12 – ADT and Modules,  
Fall 2007

CSE3302 Programming Languages, UT-Arlington  
©Chengkai Li, 2007

10

## Stack

```
type stack(element) imports boolean
operations:
  createstk : stack
  push      : stack × element → stack
  pop       : stack → stack
  top       : stack → element
  emptystk  : stack → boolean
```

**variables:**  $s$ : stack;  $x$ : element

**axioms:**

```
emptystk(createstk) = true
emptystk(push(s,x)) = false
top(createstk) = error
top(push(s,x)) = x
pop(createstk) = error
pop(push(s,x)) = s
```

Lecture 12 – ADT and Modules,  
Fall 2007

CSE3302 Programming Languages, UT-Arlington  
©Chengkai Li, 2007

11

## Axioms

- How many axioms are sufficient for proving all necessary properties?

Lecture 12 – ADT and Modules,  
Fall 2007

CSE3302 Programming Languages, UT-Arlington  
©Chengkai Li, 2007

12

## Some Heuristics

```

type stack(element) imports boolean
operations:
  createstk : stack
  push      : stack × element → stack
  pop       : stack → stack
  top       : stack → element
  emptystk  : stack → boolean
variables: s : stack; x: element
axioms:
  emptystk(createstk) = true
  emptystk(push(s,x)) = false
  top(createstk)      = error
  top(push(s,x))      = x
  pop(createstk)      = error
  pop(push(s,x))      = s
    
```

**Constructor:**  
createstk  
push

**Inspector:**  
pop  
top  
emptystk

**2 \* 3 = 6 rules**

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      13

## Binary Search Tree

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      14

## Other Examples of ADT

- Stack
- Queue
- Tree
- Set
- Bag
- Vector
- List
- Priority Queue
- Dictionary
- Graph
- ...

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      15

## ADT Mechanisms

- Specific ADT mechanisms
  - ML abstype
- General module mechanism : not just about a single data type and its operations
  - Separate compilation and name control: C, C++, Java
  - Ada, ML
- Class in OO languages

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      16

## ML Abstype

```

abstype 'element Queue = Q of 'element list
with
  val createq      = Q [];
  fun enqueue(Q lis, elem) = Q(lis @ [elem]);
  fun dequeue(Q lis)    = Q(tl lis);
  fun frontq(Q lis)    = hd lis;
  fun emptyq(Q [])     = true |
    emptyq(Q(h::t))    = false;
end;

type 'a Queue
val createq = - : 'a Queue
val enqueue = fn : 'a Queue * 'a -> 'a Queue
val dequeue = fn : 'a Queue -> 'a Queue
val frontq  = fn : 'a Queue -> 'a
val emptyq  = fn : 'a Queue -> bool

- val q = enqueue(createq,3);
val _ = - : int Queue
    
```

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      17

## Modules

- **Module:** A program unit with a public interface and a private implementation; all services that are available from a module are described in its public interface and are exported to other modules, and all services that are needed by a module must be imported from other modules.
- In addition to ADT, module supports structuring of large programs:
  - Separate compilation and name control

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      18

## C: Separate Compilation

- queue.h: header file

```

#ifndef QUEUE_H
#define QUEUE_H

struct Queuerep;
typedef struct Queuerep * Queue;
Queue createq(void);
Queue enqueue(Queue q, void* elem);
void* frontq(Queue q);
Queue dequeue(Queue q);
int emptyq(Queue q);

#endif
    
```

Incomplete type:  
Separate implementation

Simulate  
Parameteric polymorphism

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      19

## C: Separate Compilation

- queue.c: queue implementation

```

#include "queue.h"

struct Queuerep
{ void* data;
  Queue next;
};

Queue createq(void)
{ return 0;
}

void* frontq(Queue q)
{ return q->next->data;
}
...
    
```

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      20

## C: Separate Compilation

- q\_user.c: client code

```

#include "queue.h"

int *x = malloc(sizeof(int));
int *y = malloc(sizeof(int));
int *z;
*x = 2;
*y = 3;

Queue q = createq();
q = enqueue(q,x);
q = enqueue(q,y);
q = dequeue(q);
z = (int*) frontq(q);
    
```

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      21

## C: Separate Compilation

```

gcc -c queue.c
gcc -c q_user.c
gcc q_user.o queue.o -o q_user
    
```

- Not real ADT
  - casting, allocation: for parametric polymorphism
  - header file directly incorporated into q\_user.c: definition / usage consistent
  - data not protected: user may manipulate the type value in arbitrary ways
  - The language itself doesn't help in tracking changes and managing compilation/linking; thus tools like make

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      22

## C++: Namespaces

- queue.h:

```

#ifndef QUEUE_H
#define QUEUE_H
namespace MyQueue
{
    struct Queuerep;
    typedef struct Queuerep * Queue;
    Queue createq(void);
    ...
}
#endif
    
```

- queue.c:

```

#include "queue.h"

struct MyQueue::Queuerep
{ void* data;
  Queue next;
};
...
    
```

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      23

## C++: Namespaces

- q\_user.cpp:

```

#include "queue.h"

using std::endl;
using namespace MyQueue;

main(){
    int *x = malloc(sizeof(int));
    int *y = malloc(sizeof(int));
    int *z;
    *x = 2;
    *y = 3;
    Queue q = MyQueue::createq();
    q = enqueue(q,x);
    q = enqueue(q,y);
    q = dequeue(q);
    z = (int*) frontq(q);
    ...
}
    
```

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      24

## Java: Packages

```

Queue.java:
package queues.myqueue;
...
PQueue.java:
package queues.myqueue;
...
QUser.java:
import queues.myqueue.Queue;
import queues.myqueue.*;
queues.myqueue.Queue;
    
```

directory:  
queues/myqueue

class files:  
Queue.class, PQueue.class

queues/myqueue in  
CLASSPATH

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      25

## Example

- Package java.util  
<http://java.sun.com/j2se/1.5.0/docs/api/java/util/package-summary.html>
- Interface Collection  
<http://java.sun.com/j2se/1.5.0/docs/api/java/util/Collection.html>
- Class PriorityQueue  
<http://java.sun.com/j2se/1.5.0/docs/api/java/util/PriorityQueue.html>

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      26

## Ada: Packages

- Package Specification**

```

generic
type T is private;
package Queues is
type Queue is private;
function createq return Queue;
function enqueue(q:Queue;elem:T) return Queue;
function frontq(q:Queue) return T;
function dequeue(q:Queue) return Queue;
function emptyq(q:Queue) return Boolean;
private
type Queuerep;
type Queue is access Queuerep;
end Queues;
    
```

parameterized package:  
Parametric polymorphism

Prevents direct access

Pointers:  
Hide implementation details.  
Just making Queue incomplete won't work.

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      27

## Ada: Packages

- Package Body**

```

package body Queues is
type Queuerep is
record
data: T;
next: Queue;
end record;

function createq return Queue is
begin
return null;
end createq;
...
end Queues;
    
```

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      28

## Ada: Packages

- User Code**

```

with Queues;

procedure Quser is
package IntQueues is new Queues(Integer);
use IntQueues;
package FloatQueues is new Queues(Float);
use FloatQueues;

iq: IntQueues.Queue := createq;
fq: FloatQueues.Queue := createq;
begin
iq := enqueue(iq,3);
fq := enqueue(fq,3.5);
end Quser;
    
```

Import packages:  
Specify dependency

Parametric polymorphism

Overloading

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      29

## ML: Modules

- Signature (interface)**

```

signature QUEUE =
sig
type 'a Queue
val createq: 'a Queue
val enqueue: 'a Queue * 'a -> 'a Queue
val dequeue: 'a Queue -> 'a Queue
val frontq: 'a Queue -> 'a
val emptyq: 'a Queue -> bool
end;
    
```

Parametric polymorphism

Lecture 12 – ADT and Modules, Fall 2007      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2007      30

## ML: Modules

- Structure (implementation)

```
structure Queue1: QUEUE =
  struct
    datatype 'a Queue = Q of 'a list
    val createq      = Q []
    fun enqueue(Q lis, elem) = Q(lis @ [elem]);
    fun dequeue(Q lis)      = Q(tl lis);
    fun frontq(Q lis)       = hd lis;
    fun emptyq(Q [])        = true |
      emptyq(Q(h::t))=false;
  end;
```

## ML: Modules

- Use the queue

```
- val q = Queue1.enqueue(Queue1.createq, 3);
  val q = Q [3] : int Queue1.Queue
  Queue1.frontq q;
  val it = 3 : int
- val q1 = Queue1.dequeue q;
  val q1 = Q [] : int Queue1.Queue
- Queue1.emptyq q1;
  val it = true : bool
```

Must refer to implementation
