nextURL=http://www.oracle.com/index.html](https://myprofile.oracle.com/EndUser/faces/profile/createUser.jspx?nextURL=http://www.oracle.com/index.html)

[Link to download Oracle 11g](#)

<http://www.oracle.com/technetwork/database/enterprise-edition/downloads/index.html>
(It comes as two rar files, unzip it to a common folder and run the setup)

Use the username and password that we used during registration for installation.

[Oracle 11g step-by-step Installation Guide with Screenshots](#)

The above links are to setup a DB on your local machine.

On a related note:

Quite a few students have been facing the problem of connecting to the Oracle DB on Omega (I presume this will be the case with mysql too). If the program is running on a remote machine (say your computer), then there seems to be some security issues which throws a network adapter error. But you can still run the program successfully if you copy the program on the Omega server and run it from there. Follow the old help links already posted on the course web page and that should be enough to connect to the DB through a program (as long as you are running the program on Omega).
