NP-Complete Problems

- $P$ and $NP$
- Polynomial time reductions
- Satisfiability Problem
- Clique Problem
- Vertex Cover
- Dominating Set
Polynomial Algorithms

• Problems encountered so far are polynomial time algorithms
• The worst-case running time of most of these algorithms is $O(n^k)$ time, for some constant $k$.
• All problems cannot be solved in polynomial time
• There are problems that cannot be solved at all – Unsolvable
• There are problems that can be solved but not in $O(n^k)$ time for some constant time.
• Problems that are solvable in polynomial time by polynomial-time algorithms are said to be tractable (or easy or efficient).
• Problems that require superpolynomial time are said to be intractable or hard.
P and NP

• Class P problems are solvable in polynomial time.
• Class NP problems are verifiable in polynomial time.
  – For example, given a problem, we can verify the solution in polynomial time
• Any problem in P is also in NP
• $P \subseteq NP$
• It is NOT KNOWN whether P is a proper subset of NP.
NP

• **What are NP-complete Problems?**
  A problem is said to be NP-Complete if it is as ‘hard’ as any problem in NP.

• No polynomial time algorithm has yet been discovered for an NP-Complete problem.

• However, it has not been proven that NO polynomial time algorithm can exist for an NP-Complete problem.

• This problem was first posed by Cook in 1971.

• The issue of, P=NP or P≠ NP is an open research problem.
Examples of NP-Complete problems

- Shortest vs. longest simple paths

- Finding the shortest paths from a single source in a directed graph $G = (V, E)$ can be completed in $O(V E)$ time. Even with negative edge weights.

  However, finding the longest simple path between two vertices is NP-complete. It is NP-Complete even if each of edge weights is equal to one.

- An Euler tour of a connected directed graph $G = (V, E)$, can be completed in $O(E)$ time.

  However, the Hamiltonian Cycle is NP-Complete cycle.

  The traveling salesman problem is a variation of the Hamiltonian cycle.
Polynomial Time Reductions

• **Decision Problems:** Problems whose answer is yes or no!!
  Most problems can be converted to decision problems.
• Language recognition problem is a decision problem.
• Suppose \( L \subseteq U \) is the set of all inputs for which the answer to the problem is yes –
• \( L \) is called the language corresponding to the problem (Turing machines).
  The terms language and problem are used interchangeably.
• Given a problem, with an input language \( X \),
• Now the decision problem can be defined as the problem to recognize whether or not \( X \) belongs to \( L \).
Reductions Contd.

• Definition: Let $L_1$ and $L_2$ be two languages from input spaces $U_1$ and $U_2$. We say that $L_1$ is polynomially reducible to $L_2$ if there exists a polynomial-time algorithm that converts each input $u_1 \in U_1$ to another input $u_2 \in U_2$ such that $u_1 \in L_1$ iff $u_2 \in L_2$.

• The algorithm is polynomial in the size of the input $u_1$.

• If we have an algorithm for $L_2$ then we can compose the two algorithms to produce an algorithm for $L_1$.

• If $L_1$ is polynomially reducible to $L_2$ and there is a polynomial-time algorithm for $L_2$, then there is a polynomial time algorithm for $L_1$.

• Reducibility is not symmetric

• $L_1$ is polynomially reducible to $L_2$ does not imply $L_2$ is polynomially reducible to $L_1$
The Satisfiability (SAT) Problem

- S – Boolean expression in Conjunctive Normal Form (CNF) (Product (AND) of Sums (ORs))
- For example S = (x1+x2+x3)·(x1+x2+x3)·(x1+x2+x3)
- The SAT problem is to determine whether a given Boolean expression is Satisfiable (without necessarily finding a satisfying assignment)
- We can guess a truth assignment and check that it satisfies the expression in polynomial time.
- SAT is NP hard
- A Turing machine and all of its operations on a given input can be described by a Boolean Expression. The expression will be satisfiable iff the Turing machine will terminate at an accepting state for the given input.

Clique Problem

\[(x + y + \bar{z}) \cdot (x + \bar{y} + z) \cdot (\bar{x} + y + \bar{z})\]
Clique Problem

\[(x + y + \overline{z}) \cdot (x + \overline{y} + z) \cdot (\overline{x} + y + \overline{z})\]
Clique Problem

\[(x + y + \overline{z}) \bullet (x + \overline{y} + z) \bullet (\overline{x} + y + \overline{z})\]
Clique Problem

\[(x + y + \overline{z}) \bullet (x + \overline{y} + z) \bullet (\overline{x} + y + \overline{z})\]
Clique Problem

\[(x + y + z) \cdot (x + y + z) \cdot (x + y + z)\]
Vertex Cover problem

A vertex cover of $G = (V,E)$ is a set of vertices such that every edge in $E$ is incident to at least one of the vertices in the vertex cover.
Vertex Cover problem

A vertex cover of $G = (V,E)$ is a set of vertices such that every edge in $E$ is incident to at least one of the vertices in the vertex cover.

$G'$

complement of $G$
Vertex Cover problem

A vertex cover of $G = (V,E)$ is a set of vertices such that every edge in $E$ is incident to at least one of the vertices in the vertex cover.

$G$ has a maximum clique of size $|V| - k$
Vertex Cover problem

A vertex cover of $G = (V,E)$ is a set of vertices such that every edge in $E$ is incident to at least one of the vertices in the vertex cover.

$G'$ has a minimum vertex cover of size $k$ if and only if $G$ has a maximum clique of size $|V|-k$.
Vertex Cover problem

A vertex cover of $G = (V,E)$ is a set of vertices such that every edge in $E$ is incident to at least one of the vertices in the vertex cover.

$G$ and $G'$

complement of $G$
Dominating Set

- $G = (V,E)$ is an undirected graph. A dominating set $D$ of $G$ is a set of vertices (a subset of $V$) such that every vertex of $G$ is either in $D$ or is adjacent to at least one vertex from $D$.

G has a vertex cover of size $m$
Dominating Set

- G = (V,E) is an undirected graph. A dominating set D of G is a set of vertices (a subset of V) such that every vertex of G is either in D or is adjacent to at least one vertex from D.

Dominating Set

- $G = (V, E)$ is an undirected graph. A dominating set $D$ of $G$ is a set of vertices (a subset of $V$) such that every vertex of $G$ is either in $D$ or is adjacent to at least one vertex from $D$.

G has a vertex cover of size $m$
Dominating Set

• $G = (V,E)$ is an undirected graph. A dominating set $D$ of $G$ is a set of vertices (a subset of $V$) such that every vertex of $G$ is either in $D$ or is adjacent to at least one vertex from $D$.

$G'$ has a dominating set of size $m$ if and only if $G$ has a vertex cover of size $m$. 
Dominating Set

• $G = (V,E)$ is an undirected graph. A dominating set $D$ of $G$ is a set of vertices (a subset of $V$) such that every vertex of $G$ is either in $D$ or is adjacent to at least one vertex from $D$.

$G'$ has a dominating set of size $m$ if and only if $G$ has a vertex cover of size $m$.
Dealing with NP Complete problems

- Proving that a given problem is NP-Complete does not make the problem go away!! Udi Manber
- An NP-Complete problem cannot be solved precisely in polynomial time
  - We make compromises in terms of optimality, robustness, efficiency, or completeness of the solution.

- Approximation algorithms do not lead to optimal solutions
  - Probabilistic algorithms
  - Branch and bound
  - Backtracking
Backtracking

• The Hamiltonian Circuit Problem
• The Subset problem
Branch and Bound

• Job Assignment
• Knapsack
