

## Administrative Issues

- HW3 (due at March 18<sup>th</sup>)
- Essay (due at May 1<sup>st</sup>)
  - ABET requirement
  - you must get a passing score (37.5), otherwise you will receive Incomplete (I) for this course
- MP2 (due at April 3rd)
  - released at March 20th

## CSE 3302 Programming Languages

# Smalltalk (cont.)

Chengkai Li  
Spring 2008

Lecture 15 – OO Programming, Spring 2008      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008      2

## About method arguments

A>>f: x  
x := ...

Assignment to argument is not allowed.

Why?

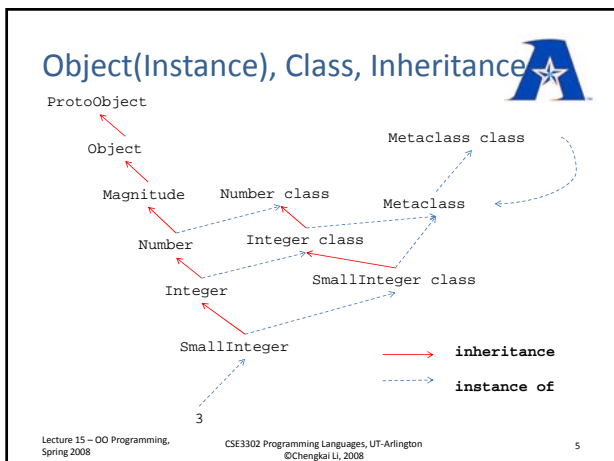

- If you want to change x, send a message to x
- If you just want to refer to another object, why don't use a different time?

Lecture 15 – OO Programming, Spring 2008      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008      3

## OO in Smalltalk

- Everything is an Object (Classes are objects too)
- Every object is an instance of a class (a class is an instance of its metaclass)
- Every class has a superclass
- Everything happens by messages.
- Method lookup follows the inheritance chain.

Lecture 15 – OO Programming, Spring 2008      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008      4

## Examples

“print it” and “inspect it”

- 3
- 3 class
- 3 class class
- 3 class class class
- 3 class class class class
- 3 class class class class class

- SmallInteger superclass

Lecture 15 – OO Programming, Spring 2008      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008      6

Be wary of the confusing names in the following several slides!!!

## Instance Variables

- **instance variable**: the variables for instances
  - defined for the instances of a class
  - click “instance” in system browser
  - Inherited in subclass (cannot be redefined in subclass)
  - each instance has its own copy

Example:

```
Number subclass: #Fraction
instanceVariableNames: 'numerator denominator'
classVariableNames: ''
poolDictionaries: ''
category: 'Kernel-Numbers'
```

## Instance Methods

- **instance methods**:
  - defined for the instances of a class
  - click “instance” in system browser
  - Inherited in subclass (can be overridden in subclass)

Example: Fraction>>+

## Class Instance Variables

- **class instance variables**: the instance variable of a class (remember a class is an instance of the corresponding metaclass)
  - defined for a class
  - click “class” in system browser
  - Inherited in subclass (cannot be redefined in subclass)
  - The class and each subclass have their own copy

Example: Very few in the system itself

```
Float class
instanceVariableNames: '' (empty)
```

## Class Instance Variables (Example)

Examples:?

## Class Methods

- **class methods**: It is not called “class instance method”!
  - defined for a class
  - click “class” in system browser
  - Inherited in subclass (can be overridden in subclass)

Example:

```
Fraction class>>numerator: denominator:
Fraction class>>one
```

## Class Variables

- **Class Variable:** it doesn't pair with "class method", which pairs with "class instance variable"
  - defined for both a class and its instances
  - click "instance" in system browser
  - Inherited in subclass (cannot be redefined in subclass)
  - **There is only one copy!** (shared by the class itself, all the subclasses, and all the instances of the class/subclasses)

### Example:

```
Number variableWordSubclass: #Float
instanceVariableNames: ""
classVariableNames: 'E Epsilon HalfPi Infinity Ln10 Ln2 MaxVal MaxValLn MinValLogBase2
NaN NegativeInfinity NegativeZero Pi RadiansPerDegree Sqrt2 ThreePi Twopi'
poolDictionaries: ""
category: 'Kernel-Numbers'
```

Lecture 15 – OO Programming, Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008 13

## Access

- All data members are private
  - Instance variables: only directly accessible to the instance itself (inside instance methods)
    - Different instances have different copies of the instance variables
  - Class instance variables: only directly accessible to the class itself (inside class methods)
    - Each subclass has its own copies of the class instance variables
  - Class variables: directly accessible to all the instances of the class and the class itself. (inside class methods and instance methods)
    - The same copy shared by all instances and subclasses
- All methods are public (any object can send any message to any other object)
  - The private instance variables are accessible to outside through the methods.

Lecture 15 – OO Programming, Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008 14

## For Accessing Private Data: Setter and Getter

### Example:

```
class Complex
instance variable real, imaginary
```

- getter
 

```
Complex>>real
^real
```
- setter
 

```
Complex>>real: aNumber
real _ aNumber (remember _ means :=)
```

Lecture 15 – OO Programming, Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008 15

## Class Methods for Constructing New Instances

- Example:
 

```
class Complex
class methods:
- Complex class>>real: aNumber1 imaginary:
aNumber2
| newComplex |
newComplex _ super new.
newComplex
real: aNumber1;
imaginary: aNumber2.
^ newComplex
- Complex class>>new
^ self real: 0 imaginary: 0
```

Lecture 15 – OO Programming, Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008 16

## Class Methods for Accessing Class Variables

### Example:

```
class Float
class variable: Pi E Epsilon ...
class method:
- Float class>>pi
^pi
```

- Compare:
  - method `real` is defined in `Complex`, so an instance of `Complex` (e.g., `3+2i`) can receive message `real`
  - method `pi` is defined in `Float class` (instead of `Float`), so an instance of `Float class` (i.e., `Float`) can receive message `pi`

Lecture 15 – OO Programming, Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008 17

## Inheritance and Handling Messages

- **Inheritance:**
  - Smalltalk allows only single inheritance
- **Method Lookup along the inheritance chains**

When an object receives a message:

  - If the class of the object has the method, use it;
  - Otherwise check the superclass, and the superclass of the superclass, and so on.
- **Return value of a method**
  - Message receiver if no explicit return (i.e., no `^`)

Lecture 15 – OO Programming, Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008 18

## Inheritance and Handling Messages

- **Overriding**
  - Multiple classes on inheritance chain may define the same method
  - Only the lowest one (starting from the receiver object) is used
  - Need to say "super methodName" if want to extend the method defined in some superclass (and this is a good practice)
    - E.g., initialize, new, ...
- **self and super**
  - both self and super refer to the message receiver itself !
  - "self methodName" will start method looking-up from the class of the message receiver.
  - "super methodName" will start method looking-up from **the parent class of the class that defines the method** which sends this message "super methodName".

Lecture 15 – OO Programming, Spring 2008      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008      19

## Example

```

A>>m2
...
A subclass: #B ...
B>>m2
  super m2

B subclass: #C...
C>>m1
  self m2

aC := C new.
aC m1
    
```

What will happen if the lookup of m2 starts from the superclass of message receiver?

Lecture 15 – OO Programming, Spring 2008      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008      20

## Examples of Super and Self

## Abstract Method, Abstract Class

- self subclassResponsibility
- Example:
 

```
Number >>+...
```

Different types of numbers (Integer, Float, Complex, ... decide the implementation of + for themselves)

Lecture 15 – OO Programming, Spring 2008      CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008      22
