

## Administrative Issues

- HW5: May 4<sup>th</sup>
- Essay: May 1st  
ABET requirement:  
you must get a passing score (37.5), otherwise you will receive Incomplete (I) for this course
- Final Review: May 1st
- Final exam: **open notes and open book**  
Thursday, May 8th, 2-4:30pm, GACB 105

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

## CSE 3302 Programming Languages

### Logic Programming: Prolog (III)

Chengkai Li  
Spring 2008

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

2

## Loops and Control:

fail and cut (!)

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

3

## fail

- Loops:
  - \* Enforce backtrack even when an answer is found (using built-in predicate **fail**)
  - \* An alternative is to type “;” to indicate a continued search.

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

4

## Example

```

• Print all solutions of appending.
printpieces(L) :- append(X,Y,L),
                 write(X),
                 write(Y),
                 nl,
                 fail.

?- printpieces([1,2]).
[[1,2]
[1][2]
[1,2][]
fail

```

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

5

## Example

```

• num(0).
  num(X) :- num(Y), X is Y+1.
?- num(X).

• writenum(I,J) :- num(X),
                 I =< X,
                 X =< J,
                 write(X),
                 nl,
                 fail.

?- writenum(1,10). (Will this work?)

```

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

6

## cut

- Cut (using built-in predicate `!`) branches in the search tree (to avoid infinite loop).
- “freezes” the choice made when “`!`” is encountered.
- If “`!`” is reached on backtracking, the search of the subtree at the parent node of the node containing “`!`” stops, and the search continues with the “grandparent” node.

## Example

```

writenum(I,J) :- num(X),
                I =< X,
                X =< J,
                write(X),
                nl,
                X = J, !,
                fail.
?- writenum(1,10).
    
```

## Where to cut exactly?

## Where to cut exactly?

## Where to cut exactly?

## Where to cut exactly?

### Where to cut exactly?

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkal Li, 2008 13

### Where to cut exactly?

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkal Li, 2008 14

### Where to cut exactly?

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkal Li, 2008 15

### Where to cut exactly?

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkal Li, 2008 16

### Where to cut exactly?

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkal Li, 2008 17

### Where to cut?

- *The cut (!) goal always succeeds.*
- *All the choices made before ! are frozen.*
- *Along the path from the node where ! is introduced into the goals till the node where ! is reached (all previous goals satisfied), all the siblings of these nodes are pruned.*

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkal Li, 2008 18

## Exercise 1

- Duplicate the elements in a list, using the numbers of duplicates specified in another list.
- E.g.,  
?- duplicate([1,5,3], [2,1,4], Result).

Result = [1,1,5,3,3,3,3].

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

19

## Exercise 1

```
duplicate_single(H, 0, []).
duplicate_single(H, N, [H|U]) :- N>0,
                                M is N-1,
                                duplicate_single(H,M,U).
duplicate_list([], _, []).
duplicate_list([H|T], [N|Ns], Result) :- duplicate_single(H,N,U),
                                         duplicate_list(T,Ns,V),
                                         append(U,V,Result).
```

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

20

## Exercise 2

- An example with predicates containing predicates
- Binary Tree  
e.g.,  
tree(1,tree(2,tree(4,tree(8,void,void),void),tree(5,void,tree(9,void,void))),tree(3,tree(6,void,tree(10,void,void)),tree(7,tree(11,void,void),void))).

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

21

## Exercise 2

- ordered (T): true if T is ordered  
(For each node n, all nodes in n's left subtree are smaller than n, and all nodes in n's right subtree are larger than n. Assuming no duplicates).

```
ordered(T) :- ordered(T, Min, Max).
ordered(tree(X, void, void), X, X).
ordered(tree(X, L, void), Min, X) :- ordered(L, Min, Max), X>Max.
ordered(tree(X, void, R), X, Max) :- ordered(R, Min, Max), X<Min.
ordered(tree(X, L, R), Min, Max) :- ordered(L, Min, Max1), ordered(R, Min2, Max), X>Max1, X<Min2.
```

Lecture 23 – Prolog (III), Spring 2008 CSE3302 Programming Languages, UT-Arlington ©Chengkai Li, 2008

22

## Exercise 3

```
student(Amy).
student(Bob).
take(Amy, CSE3302).
take(Amy, CSE3303).
take(Amy, CSE3304).
take(Bob, CSE3301).
take(Bob, CSE3303).
credit(CSE3301, 3).
credit(CSE3302, 3).
credit(CSE3303, 4).
credit(CSE3304, 2).
```

```
?- student(X), take(X, Y), credit(Y,Z).
?- !, student(X), take(X, Y), credit(Y,Z).
?- student(X), take(X, Y), !, credit(Y,Z).
?- student(X), take(X, Y), credit(Y,Z), !.
```
